Pilot Project in Japan

Transporting the pre-fused pipes, dimension d 90 mm, to the trench.

Fused ELGEF Plus sockets. In Japan, the blue pipes and fittings are used for water.

To join the 5 m long pipe sections, an ELGEF Plus socket is the answer.

APPLICATIONS

We recently heard from our joint venture, Kubota George Fischer, that the first pilot project in Japan with ELGEF Plus sockets, d 90 mm, was a big success.

Mike Holborn, Technical Sales Consultant for Distribution, was on location to train the installers and prepare them for electrofusion with the ELGEF Plus system. In Japan they only use blue pipes and fittings for water. The Japanese installers are very satisfied with the ELGEF Plus electrofusion technology, which warrants a complete safety by using the material PE 100, integrated pipe fasteners and magnetic cards. We are pleased to be pioneers in the distribution sector in Japan with our advanced electrofusion technology.
